Section 1: Executive Summary

What Can I Plant? is a proposed web application for Pocket Habitat Melbourne, a fictional not-for-profit organisation that promotes practical urban greening, biodiversity awareness and environmental learning across Melbourne. The project responds to a simple barrier to participation: many residents want to grow plants or support local biodiversity but have limited outdoor space, limited horticultural knowledge, or difficulty identifying reliable and locally relevant information. The client therefore aims to make small-scale gardening more approachable, encourage responsible plant choices, connect people with community environmental activities, and support families and schools in using gardening as a practical learning experience.

The primary audience consists of three groups: beginner urban gardeners living in apartments or homes with limited planting space; parents seeking accessible environmental activities to complete with children; and primary-school teachers or sustainability coordinators looking for reliable planting and biodiversity resources. Their needs overlap around clear guidance, appropriate plant selection and local information, while differing in the depth, purpose and educational context in which that information is used.

The application will centre on a searchable Plant Guide that helps users discover suitable plants according to available space, sunlight, maintenance level and environmental value. Supporting sections will provide small-space and seasonal gardening guides, responsible plant and seed sourcing information, education about invasive and threatened flora, local workshops and community planting events, and a blog-based Community Stories area where users can read experiences and leave moderated comments.

Original research informed this content structure. Sustainable Gardening Australia demonstrates how a not-for-profit can combine practical sustainable-gardening advice with community resources and gardening stories. CERES provides locally relevant seasonal advice for Melbourne and explicitly addresses gardening in backyards, balconies and other small spaces. Junior Landcare demonstrates the value of structured biodiversity and gardening activities for children and educators. Victorian Government resources also show the importance of responsible indigenous plant sourcing and reliable environmental information.

The primary goal of What Can I Plant? is therefore not to become a commercial nursery or a professional botanical database, but to provide a concise pathway from “I want to grow something” to informed planting, environmental learning and local community participation.

Section 3: User Personas

Maya Chen: Beginner Small-Space Gardener

Maya is a 24-year-old postgraduate student who rents a one-bedroom apartment in Carlton, Melbourne. She has a small north-facing balcony and no private garden. She is interested in sustainability and would like to add greenery to her apartment, but her gardening experience is limited to a few indoor plants. Her budget is modest, and she prefers plants that are inexpensive, resilient and easy to maintain around study and part-time work.

Maya's main goal is to understand what she can realistically grow in a small space without wasting money on unsuitable plants. She needs recommendations based on balcony conditions, sunlight, container size, season and maintenance difficulty. She is also interested in native flowering plants that can support bees and other urban wildlife, but finds scientific plant databases overwhelming and general gardening websites insufficiently specific to Melbourne.

Her main pain points are information overload, conflicting online advice and uncertainty about where plants or seeds should be sourced responsibly. She may also unknowingly choose an invasive species or a plant that will quickly outgrow its container.

What Can I Plant? supports Maya through a searchable Plant Guide with simple filters for space, light, difficulty and biodiversity value. Plant profiles explain care requirements in accessible language and link to responsible local sourcing information. Small-space and seasonal guides give her a clear starting point, while community stories provide practical examples from people gardening under similar constraints.

Daniel Morgan: Parent and Home Learning Facilitator

Daniel is a 38-year-old parent living in Coburg with two children aged seven and ten. He works full-time in administration and has a small courtyard rather than a large garden. He is not a gardening enthusiast, but he regularly looks for inexpensive weekend activities that are educational, practical and engaging for his children. He wants them to understand where plants come from, recognise local wildlife and develop positive habits around environmental responsibility.

Daniel needs short, achievable gardening activities that do not require specialist equipment or extensive preparation. He would like to identify child-friendly plants, create a small pollinator garden, grow a plant from seed, and occasionally attend a nearby community planting day or environmental workshop. He values reliable explanations because he wants to answer his children's questions accurately.

His pain points include limited time, uncertainty about which online resources are appropriate for beginners, and gardening instructions that assume too much prior knowledge. Long technical articles are unlikely to hold his attention, and failed projects may discourage his children.

What Can I Plant? provides beginner and family gardening guides organised around manageable projects, with relevant plants linked directly from each activity. Biodiversity pages explain topics such as pollinators, invasive plants and threatened flora in approachable terms. The local events section allows Daniel to discover family-suitable workshops and planting activities, extending home learning into community participation.

Rachel Williams: Primary-School Sustainability Coordinator

Rachel is a 43-year-old Year 4 teacher and sustainability coordinator at a Melbourne primary school. She helps organise environmental activities alongside her teaching workload and works with limited funding, time and gardening expertise. Her school has several raised beds and a small unused outdoor area that could support a native or wildlife-friendly garden.

Rachel's goals are to create practical learning activities connected to biodiversity, plant lifecycles and environmental responsibility; select plants that are manageable in a school environment; and find local programs or community events that can extend classroom learning. She requires information that is credible, easy to prepare and understandable for primary-school students. She also wants examples of projects completed by other families, schools or community groups.

Her pain points are fragmented resources, uncertainty about plant suitability, limited preparation time and the difficulty of converting professional environmental information into classroom-ready activities. She must also avoid plants that are inappropriate, invasive, hazardous or excessively demanding to maintain.

What Can I Plant? gives Rachel a dedicated collection of school gardening and biodiversity resources supported by the same structured Plant Guide used elsewhere in the application. She can compare low-maintenance plants, review environmental warnings, locate suitable learning activities and discover community events. Community Stories can showcase school projects and allow educators or gardeners to exchange moderated, topic-specific advice without requiring a complex social-network platform.

VICTORIAN NATIVE

BEGINNER

POLLINATORS

Native Violet

Viola hederacea

A compact native groundcover for shaded pots and small Melbourne gardens.

SUNLIGHT Part shade

WATER Moderate

HEIGHT 10–15 cm

FLOWERS Spring–summer

WHERE TO FIND IT →

Is this plant right for me?

✓ Good for balcony pots ✓ Handles part shade ✓ Beginner friendly ✓ Supports small pollinators

CHANGE MY CONDITIONS

MATCH: HIGH

How to grow Native Violet

1Choose a pot

Use a wide container with drainage holes.

2Prepare soil

Use a free-draining native potting mix.

3Plant

Keep the crown level with the soil surface.

4Maintain

Water when the top layer begins to dry.

Biodiversity value

Flowers provide food for small native bees. Dense growth creates cool, sheltered ground cover.

Home / Gardening Guides / Family Gardening / Build a Pollinator Pot

Build a Pollinator Pot

A small-space project for beginners, families and classrooms.

LARGE PROJECT IMAGE PLACEHOLDER

What you'll need

30–40 cm pot with drainage

Native potting mix

3 pollinator-friendly plants

Watering can

Small trowel

Mulch

Before you start: choose a spot with at least 4 hours of sun.

Step by step

01Prepare the pot

Cover the drainage hole loosely and fill two-thirds with potting mix.

02Plan the layout

Place taller plants at the back and trailing plants near the edge.

03Plant and firm

Set each plant at its existing soil level, then gently firm around roots.

04Water and observe

Water deeply. Track insect visitors over the next four weeks.

Recommended plants

Chocolate Lily

Common Everlasting

Native Violet

sun · bees

sun · butterflies

COMPARE PLANTS

Family / school learning idea

Create a weekly "pollinator count". Record the insect type, weather and flower visited. Compare the results after four weeks.

How our students transformed an unused courtyard

Our Year 4 students began with one question: could a small paved courtyard support local insects? Working in teams, they measured sunlight, selected hardy native plants and built four container habitats. The project connected science, data collection and practical environmental action. After six weeks, students recorded native bees, hoverflies and butterflies visiting the new flowers.
